NET MANAGER SECURE 1.2.1 RELEASE NOTES

Release Date: 14 October 2016

This document contains information about Net Manager Secure v1.2.1. This version requires net_mgr 3.10.0+ and CryptKeeper 5.6.8+. For other requirements and compatibility information, see the *Requirements and Product Compatibility Matrix for AMI*.

Who Should Upgrade

This release of Net Manager Secure fixes performance issues, adds support for larger CryptKeeper key sizes, and also encrypts the CryptKeeper password. Users who want to benefit from these improvements should upgrade to this release.

New Features

The following features were added in net_mgrS version 4.10.

1. CryptKeeper password encrypted (NETMGRS-47)

net_mgrS now encrypts the CryptKeeper password.

2. net_mgrS supports larger keys (NETMGRS-55)

net_mgrS now supports the larger keys returned by CryptKeeper.

Resolved Issue

The following issue was resolved in version 4.10:

1. Performance improved (NETMGRS-48)

`net_mgrS` no longer slows down over time.

NET MANAGER SECURE 1.2 RELEASE NOTES

Release Date: 6 July2016

This document contains information about Net Manager Secure v1.2. This release requires net_mgr 3.10.0+ and CryptKeeper 5.6.4+.

Who Should Upgrade

This release of Net Manager Secure fixes an issue related to security association. Customers should upgrade to Net Manager Secure 1.2 to fix this issue.

Resolved Issues

The following issue was resolved in version 4.10:

1. net_mgrS now hides the secret key from Net_mgr (NETMGRS-28)

`net_mgrS` no longer passes the secret key to `net_mgr` on the command line.

net_mgrS now can use High Strength KeySafe via CryptKeeper.

Note: Multiple instances of net_mgrS invoked to the same CryptKeeper, will end up with the same effective association. This will affect performance (commands will need an extra packet to prepare the association for use).
